Abstract

The impact of the coronavirus (covid-19) is extensive and has become a global health problem. Student interactions with teachers are carried out face-to-face in the classroom, especially in schools. However, now teachers are required to be able to teach from home through online learning, although with limited distance learning tools and facilities, this is supported by the Indonesian government policy, namely learning directly from home or learning from home. The study aims to prove the effectiveness of the Indonesian government policy of teaching from home to teacher competence in the use of e-learning and social media. The research method utilizes a quantitative approach with SEM statistical analysis with smart pls. There were 198 participants from elementary school teachers in East Kalimantan province, Indonesia. The results of this study are that government policy has a significant influence on the competence in mastering e-learning of teachers, and this policy also has a positive effect on the competence of teachers' use of social media.

Keywords— Indonesia Government Policy, distance learning, e-learning, adopted social media

1 **Introduction**

2 The World Health Organization (WHO) has declared the Corona Virus or COVID-19 as a
3 pandemic because it has spread to more than 100 countries in the world. WHO itself defines
4 a pandemic as a situation when the entire world population is likely to be affected by this
5 infection, and potentially some of them fall ill. Quoted from the Big Indonesian Dictionary
6 (KBBI), a pandemic is a plague that is contagious everywhere or covers extensive geography.
7 Corona virus is a frightening and deadly scourge for all humans in various countries. Its
8 presence has claimed hundreds of thousands of lives. In fact, in Indonesia alone, almost ten
9 thousand people have tested positive for the Corona virus. The spread of the virus according
10 to data ⁶⁵ from the Ministry of Health of the Republic of Indonesia up to May 4, 2020, the number
11 of positive exposed as many as 10,843, the number in treatment 8,347, the number who have
12 recovered 1,665 and the number of dead 831 people (<https://covid19.go.id/peta-sebaran>) the
13 data might increase later.

14 The ⁹ COVID-19 pandemic will have an impact on various sectors of life, such as the
15 ³⁴ economy, social, including education. The United Nations Educational, Scientific, and Cultural
16 Organization (UNESCO) on Thursday (5/3) stated that the Corona virus outbreak had an impact
17 on the education sector. Nearly 300 million students are disrupted by their school activities
18 throughout the world, and there are severe threats to their educational rights in the future.
19 In Indonesia, the education sector also experienced the impact of Covid-19. ⁵⁶ In accordance with
20 the Minister of Education and Culture (Mendikbud) Nadiem Anwar Makarim issued a Circular
21 Letter Number 4 of 2020 concerning the Implementation of Education in the Emergency
22 Coronavirus Disease (Covid-19) while for the matter of education the education material
23 emphasized that online learning was carried out for online provide a meaningful learning
24 experience for students as for school exams in the form of distance assignments (Mendikbud
25 RI, 2020) .

26 ¹⁷ Teachers must ensure teaching and learning activities continue even though students
27 are at home, learning innovations are solutions that need to be designed and implemented by
28 teachers by maximizing existing media such as online media (Zulherman, 2020). Teachers can
29 do learning using E-Learning, namely learning to use information and communication
30 technology (Horton & Horton, 2003). The learning system is implemented through a computer

1 (PC) or laptop connected to an internet network connection. Teachers can do learning
2 together at the same time using groups on social media such as Whatsapp (WA), telegram,
3 Zoom applications, or other social media as a learning tool so can ensure students learn at the
4 same time even in different places. The teacher can also provide measurable tasks but still
5 ensure that every day the learning of students is carried out step by step from the task. Many
6 other innovations that can be done by educators to ensure learning continues, and students
7 get knowledge according to the curriculum that has been prepared by the government. There
8 are various online applications implemented by each subject teacher that are applied
9 according to the material requirements and basic competencies that are being implemented.
10 Among other e-learning, Google classroom, webex, video conferencing, and some are using
11 the WhatsApp application or using a combination of e-learning and WhatsApp or also Google
12 classroom (Bhat et al., 2018) with WhatsApp.

13 Distance learning in the world is not something new advances in information and
14 communication technology have brought many changes to developing countries using e-
15 learning in distance learning (Napitupulu et al., 2018). Currently, Higher Education in Indonesia
16 adopts a policy that educational institutions in Indonesia are closed for learning in the
17 classroom or to eliminate ⁴⁹ face-to-face learning activities instead of distance learning. This
18 situation is an emergency for the decision of the Indonesian Ministry of Education so that all
19 teachers teach at home with distance learning platform facilities. All teachers are required to
20 prepare from home so that their alternatives adopt ⁶⁸ social media for teaching tools and as e-
21 learning. The ease and availability of internet connections have increased the possibility of
22 teachers and students interacting with each other for teaching and learning activities, ³ which
23 in turn causes the physical school environment to turn into a virtual platform on social media.

24 Before the corona virus pandemic (covid-19) was so widespread and became a global
25 health problem, student interactions with teachers were carried out face-to-face in the
26 classroom, especially at school. However, now teachers are required to be able to teach from
27 home with limited distance learning tools and facilities, both in terms of e-learning
28 competencies and the ability to use teaching tools adopted from social media, with the aim
29 that teachers can interact with students and teachers continue to teach with easily through
30 social media platforms. Teacher and student readiness in home learning varies, some are

1 ready, forced to be prepared, and not ready. Without any preparation, the teaching and
2 learning system changes from face to face to online by utilizing technology.

3 So far, many schools have implemented online assignment methods for students. The
4 assignment was carried out through various social media, which were in an emergency
5 condition because of the corona virus as it is now, the form of the task that was considered
6 effective in distance learning. Consequently, the introduction of the concept of a lesson as
7 applied in face-to-face learning cannot work well (Salehudin, 2020).

8 Mostly ⁶⁰ with the advent of the Internet and emerging technologies, e-Learning has
9 become a popular solution for universities in the world undergoing rapid change at the
10 moment. Considering students' perceptions of e-learning technology, their expertise in this
11 field is very important to successfully build academic programs because the end-user attitude
12 towards technology implementation is one of the most influential factors (Popovici &
13 Mironov, 2015), and social media brings ⁴ great challenges and extraordinary opportunities for
14 ⁴ learning educational institution or campus. With the support of social media, the university
15 can facilitate the management process and e-learning knowledge for all lecturers and students
16 (Zhang et al., 2015).

17 A research study to save ⁷ the use of social media as a means of learning and active
18 collaborative assistance in literature and its effect on learning outcomes in research in
19 Malaysia. Based on the findings, the satisfaction of men and women with the ⁷ use of social
20 media for women's education Collaboration and constructive engagement increases their
21 learning, and they are not happy with their understanding of the use and usefulness in
22 accordance with the problems faced by women. Through research, active, interactive learning
23 and social media involvement strengthen student learning experiences and facilitate
24 conversations and community use that must be supported in the context of ²⁰ learning and
25 teaching in higher education institutions (Al-Rahmi et al., 2018).

26 In the ³¹ past decade, the number of available social media resources has increased
27 dramatically. Apart from the evidence of positive adoption in university classrooms,
28 longitudinal research is relatively little investigated ³⁵ whether the use of blogs in teaching and
29 learning contributes to the improvement of students' understanding of knowledge. (Garcia et
30 al., 2019). Public social media are generally used in structured schools but are not explicitly

1 developed for education. Although highly successful online networks such as Facebook and
2 Twitter have been extensively studied for their benefits in higher education enhancing
3 teaching and learning, the scientific community is not yet widely aware of other social media
4 channels that have received great attention among young people. The findings show that,
5 given the use of WhatsApp, works on Instagram, Pinterest, and Snap-chat are well-known in
6 several studies. Studies that analyze social media learning represent the expectations shared
7 by the general public for this service. Besides, it was found that social media pedagogical costs
8 were only partially met and that different social media costs were misused to varying degrees
9 (Garcia et al., 2019), (Shen & Ho, 2020).

10 Distance learning has been generally applied in higher education institutions in
11 Indonesia. PTJJ or Distance College has been formally regulated in ⁸ Law No. 20 of 2003
12 concerning National Education System article 31 and Minister of Education Decree No. 107 /
13 U / 2001 concerning PTJJ. The law allows education providers in Indonesia to carry out
14 education through Distance Education (PTJJ) by utilizing information technology. Social media
15 has grown rapidly along with the penetration of smart mobile devices and the affordability of
16 communication and data packages in Indonesia. In a study conducted by researchers at a State
17 University of Makassar that as many as 75% were accustomed to using social media. They are
18 very familiar and accustomed to using social media applications in learning Ruslia et al (2020)
19 research on the ¹¹ use of social media has also been carried out by researchers from a
20 Department of Information Systems, STT Integrated Nurul Fikri and presented in a The Fifth
21 Information Systems International The 2019 Conference (Muh. Syaiful Romadhona, Amalia
22 Rahmaha, Yekti Wirania) produced a mixed learning system strategy for learning Tahsin using
23 social media, with several issues that needed attention. They study curriculum and material
24 design, strategies to maintain participant commitment through the provision of reward
25 mechanisms, and encourage collaboration in the process, such as reading the Qur'an together.
26 Evaluations show positive results with excellent predicate intervals. At the tertiary level, the
27 ⁴ use of social media can facilitate the learning process, the obstacle in the use of social media
28 among universities is that not all regions in Indonesia have high-speed internet networks.
29 ⁶⁶ When the literature is examined, it appears that many studies are investigating either
30 ⁷¹ the effects of social media on learning and learning ²⁶ in higher education (Zha et al., 2016),

1 (Hashim et al., 2018), (Demir & Şad, 2020), (Cao et al., 2013), (Rauniar et al., 2014), (Pfeffer et
2 al., 2015) or the use of social media for e-learning (Moghavvemi et al., 2018), (Moghavvemi &
3 Salarzadeh Janatabadi, 2018) (Balakrishnan & Lay, 2015) (Al-rahmi & Zeki, 2017) the use of
4 social media to improve learning outcomes (Salehudin et al., 2019) (Ractham & Firpo, 2011).
5 However, limited research has been found about the use of social media by primary education
6 teachers as a distance learning tool in Indonesia. In this case, it is assumed that the findings of
7 this study will contribute to adding literature related to distance learning in particular during
8 the co-19 pandemic in Indonesia.

9 Thus, this study aims to prove the effectiveness of the Indonesian government policy of
10 teaching from home to teacher competence in the use of e-learning and social media in
11 distance learning in Indonesia by adopting social media as an e-learning tool and facility based
12 on perceptions of basic education teachers. To achieve this goal, there are three research
13 questions (RQ) in this study, namely as follows:

14 RQ # 1 Does the Teaching Policy from Home Affect E-Learning Knowledge Competence?

15 RQ # 2 Does the Teaching Policy from Home Affect Competency in Using Social Media?

16 RQ # 3 Does E-Learning Knowledge Competence affect Competency in Using Social
17 Media?

18 **Adopting Social Media as E-Learning**

19 E-learning is one of the applications of information systems that are utilized in the
20 learning process for teachers and students (Hubackova & Ruzickova, 2015). Students are
21 expected to learn independently through e-learning outside of meetings conducted in class.
22 The use of e-learning is done to change the learning model to be better and move the learning
23 process toward digital, both from the content of learning and the learning system that is
24 applied. The interaction between teachers and students on the use of e-learning becomes an
25 integral object of interaction [6]. The user is the primary determinant of e-learning, whether
26 it is feasible or not to be used. E-learning can be said to be successful if the system quality
27 factor and the quality of information generated by e-learning are able to provide satisfaction
28 to the user (Can, 2015). User satisfaction can be demonstrated through the user's willingness
29 to accept and use e-learning until, finally, e-learning can improve user performance (Inayat et
30 al., 2013).
31

1 Social media is a place where people make friends from various countries and cultures.
2 Recently, especially among the younger generation, ³⁰ social media platforms such as Facebook,
3 ²⁴ Twitter, and YouTube have become very popular (Lam et al., 2014) and instagram (Salehudin
4 et al., 2020). The use of social media as a learning medium for students becomes an alternative
5 that can be chosen (Lee et al., 2011). This is based on: First, the development of science and
6 technology is moving very fast, which is accompanied by an increase ¹⁵ in the use of social media.
7 Social ¹⁵ media is now not only a means of communication (Lee et al., 2011). But it is also used
8 for various activities, both in the economic, social, and educational fields. According to
9 research conducted by we Are Social in collaboration with Hootsuite, in 2018, social media
10 users in Indonesia are 130 million people or 49% of Indonesia's population. Not only that, the
11 average use of social media every day for 3 hours 23 minutes. Of all these users, including
12 students ranging from elementary schools to tertiary institutions. By referring to this data,
13 social media is a place that is often visited by the people of Indonesia.

14 This is inversely proportional to reading habits, which only ranked 60 out of 61 countries
15 sampled by UNESCO. Secondly, social media is very popular with students. This ²⁹ is based on
16 ²⁹ the results of a study conducted by Essay Writing Service UK, which found the fact that the
17 main reason for interesting social media is (1) More contemporary; (2) more effective
18 communication; (3) can seek opinions; and (4) its use is pleasant. Third, according to learning
19 theory, students will easily accept the subject matter if they like it so that it is more meaningful
20 and can foster long-term memory (long time memory). To realize the intended ⁴⁰ learning, the
21 ⁴⁰ use of social media as a learning medium becomes very relevant.

22 WhatsApp is an instant messaging application for smartphones; when viewed from its
23 function, WhatsApp is almost the same as the SMS application that you usually use on older
24 mobile phones. But WhatsApp does not use pulses, but rather internet data. Messages are in
25 the form of the chat, which in real-time can send messages quickly. Equipped with features
26 such as WhatsApp group that makes it easy for students to create groups that are indeed used
27 as a medium for fellow students to be able to discuss each other about learning, besides that
28 there is also a WhatsApp call feature that makes students more facilitated and benefited when
29 using the WhatsApp application in their learning, the reason this feature makes students save

1 expenses for credit purchases because WhatsApp provides this feature for free to call by only
2 requiring a connection to the internet.

3

4 **Literature Review**

5 **The Policy of Teaching From Home Affects E-Learning Competency**

6 Teaching at home was a government policy when the global outbreak of Covid-19, this
7 provision with a circular from the ministry of education and culture of the Republic of
8 Indonesia about teaching and lecturing from home (Mendikbud RI, 2020) as the ministry of
9 education established the policy of ⁴²Working from Home for Preventing the Spread of COVID-
10 ⁵19 is Minister of Education and Culture Circular Letter Number: 36962 / MPK.A / HK / 2020
11 concerning Online Learning and Working from Home in the Context of Preventing Corona
12 Virus Disease (COVID-19).

13 Technology is an important element of distance learning (Bates & Bates, 2005),
14 strengthening teacher professional and e-learning abilities (Turvey, 2012). The teacher has
15 become the person who guides students not about providing knowledge but the way students
16 achieve knowledge (Cavus, 2015) pay attention to aspects of student life following distance
17 learning because not all students are the same and need to be planned well (M. Brown et al.,
18 2015) that means the teacher uses e- learning so that students can follow properly and
19 appropriately. Then the teacher must have the right e-learning knowledge. Pedagogical
20 practices are used to build a framework for evaluating the use of online platforms (Heggart &
21 Yoo, 2018) so that it is easy to ¹³explore the usefulness of online learning platforms from four
22 identified concepts (speed, ¹³ease of access, collaboration, and student voice/agency).

23 **H1. The** Teaching Policy from Home affects E-Learning Knowledge Competence
24 significantly

25

26 **The Policy of Teaching From Home With Social Media Competency (X-Z)**

27

28 In teaching from home policies, the Ministry of Education and Culture establishes
29 collaboration with various institutions providing online learning and e-learning, providing free
30 e-learning learning facilities [28]. Although these facilities are provided, not all teachers are

1 able to use the e-learning with various obstacles, and technological infrastructure can be the
2 main cause as important factors that influence technology acceptance and full adoption of e-
3 learning. So the teacher chooses to adopt social media with the perception that social media
4 is easier to use compared to specialized e-learning platforms such as Moodle (Karkar et al.,
5 2020).

6 According to Mao (2014) secondary school teachers can use social media for teaching
7 and learning in class, where students show positive attitudes and beliefs about the use of
8 social media in education (Mao, 2014), because the use of social media has the potential to
9 enhance primary and secondary learning (Krishnan et al., 2005) reinforced, that social media
10 provides higher performance, has a positive effect on student learning outcomes and student
11 satisfaction (Cao et al., 2013) social media has been used as a learning interaction platform
12 (Jumaat et al., 2019) as a useful tool that can enhance learning experiences (Moghawwemi et
13 al., 2018).

14 According to Turvey (2012), the role of technology is able to characterize teacher-
15 student interactions in social media practices and teacher professionalism, taking into account
16 broader socio-cultural ecology. Generation Y students are encouraged to participate actively
17 because they feel comfortable using technology (Alwi et al., 2014), social media is used as a
18 means of learning collaborative learning to achieve better student performance (Al-rahmi &
19 Zeki, 2017) Social media is very popular among students and helps them in various types
20 communication and collaborative learning (Ali et al., 2017).

21 **H2.** The Teaching Policy from Home affects the Competency in Using Social Media
22 significantly.

24 **E-learning knowledge competencies affect competency in using social media**

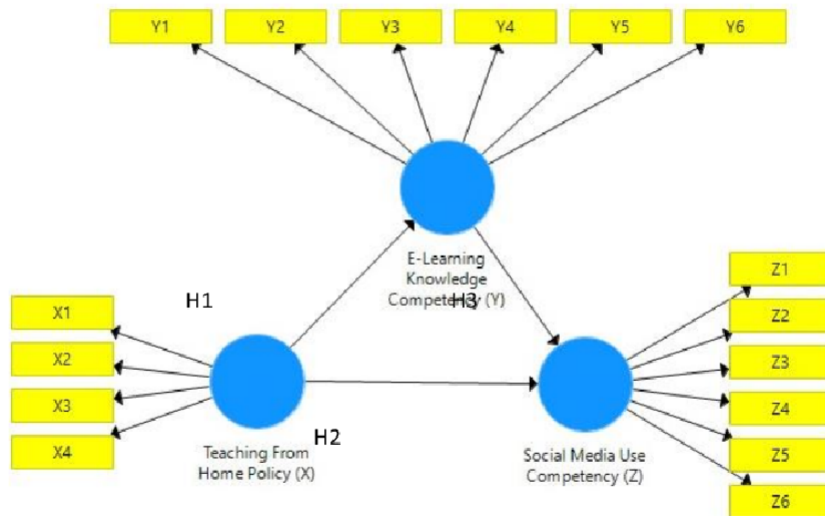

25 E-learning is the right choice for teachers to teach distance learning (Cavus, 2015), so
26 Mayer (2017) also explained that multimedia is appropriate for e-learning learning. The
27 teacher applies varied learning so that students like it, and students can study anywhere
28 without a time limit. The success of the e-learning system depends on the relevance that
29 matches the preferences of individual students with their ability to retrieve and recommend
30 learning content (Aleksandra et al., 2018) automatically. Teachers' trust in e-learning with E-

1 learning User Interface (ELUI) is effective (Farhan et al., 2019) use of a Flipped classroom with
2 e-learning (Elfeky et al., 2020).

3 Previous studies that showed e-learning by adopting social media with internet
4 networks (Friesen, 2012) adoption of social media for reasons of ease of use in addition to
5 other e-learning (Karkar et al., 2020), so easy, then teachers using social media (Facebook) can
6 be observed 24 hours and teachers have the opportunity to be involved in informal
7 professional development (Rutherford, 2013). Teachers using social media can achieve
8 student learning outcomes in secondary schools (Salehudin et al., 2019), the cognitive
9 achievement of learning outcomes with WhatsApp (Budiasih & Wonorahardjo, 2017), through
10 social media and blended learning facilitate the learning process that presents a different
11 learning experience, overcoming gaps and problems in learning to facilitate the learning
12 process (Syaiful Romadhon et al., 2019) is beneficial for them in terms of providing innovative
13 ways of learning; foster more significant interaction between fellow students and staff
14 (Thalluri & Penman, 2015).

15 According to ⁵³Liu (2010), social media as a learning resource ²¹(Liu, 2010), social media
16 networks as a learning tool (Kolokytha et al., 2015), the results reveal a significant influence
17 of Self and Performance, which significantly influences using social media (Lay, 2015). A
18 validity and reliability test for ¹⁶the use of social media has been conducted for secondary school
19 students (Cengiz, 2018). Learning outcomes may not satisfy, but students who fail in learning
20 tend to interact less often using social media (Davies & Graff, 2005). Learning to use social
21 media, student presentations, and peer criticism through social media in exploring academic
22 concepts/theories is more open and can spur individual and group development (Jenkins &
23 Dillon, 2013).

24 **H3. E-Learning Knowledge Competence affects the Competency in Using Social Media**
25 significantly.

1

2

Figure 1. Research Model

3

Method

4

The research method used in this study is the integration of two independent variables (X) and (Y), where the variable (X) of government policy and the variable (Y) of e-learning competencies in teachers, and with one dependent variable (Z) of competence in the use of social media, then done by combining each component involved to be able to describe the measured variables.

9

Participants in this study were elementary education teachers who were assigned as respondents totaling 198 teachers who were determined by sampling procedures using multi-stage or clustering sampling (Creswell, 2014), the initial stage of the researchers first determined the clusters by determining (groups of primary education teachers domiciled in the province of East Kalimantan) located in 4 cities/districts; the next step is to contact the teacher coordinator through the organization of basic education teachers, then identify the names of individuals in each cluster, then conduct a sampling of the individual basic education teachers. Determining the selection of individual participants using random sampling randomly from primary education teachers, which is very possible to be sampled, because in the group of teachers in the population have the same possibility to be selected (Curran, 2011). Participants in the survey method, questionnaires sent (Jonassen, 2005). In this study,

19

1 questionnaires given to collect data using Google forms were distributed through the
2 WhatsApp network, bearing in mind that in this situation, the government established "social
3 distancing" and basic education teachers as participants all active at home. Returning the
4 answers has been checked as data in this study. The research instrument consisted of 16
5 items. The sample descriptions are in the following table:

6

7 **Table 1.**

8 *Samples of Demographics*

Subject	Information	N
Gender	Male	71
	Female	127
	Total	198
Education	Bachelor Degree	188
	Master Degree	10
	Total	198
% Social Media	Whatsapp (84%)	167
	Facebook (FB) (7%)	14
	Instagram (IG) (4%)	8
	Youtube (5%)	9
	Total (100%)	198
Ages		24-50 years old

9

10 Data analysis using ³⁷ PLS-SEM (Partial Least Square structural equation modeling)
11 technique and SmartPLS ver 3.2.8 software had been used to run the statistical analysis in
12 order to test the hypothesis proposed. PLS-SEM is a well-known application that has
13 advantage, such as small sample size (T. A. Brown, 2015).

14

Findings

15 To determine the normal distribution of data collected in this study, normality testing
16 was conducted based on Kolmogorov-Smirnov using SPSS software (IBM ver. 25), following
17 the Zarei-Ghanavati study (2019). The test results show the data obtained do not have a
18 normal distribution because of the value of $P < 0.05$ for all three variables. Furthermore, the
19 analysis process is carried out with the help of SmartPLS software (ver. 3.2.8) because PLS
20 (Partial Least Square) can be used to handle abnormal data distribution (non-parametric data).
21 Based on Anderson & Gerbing (1988), it is recommended two stages or procedures in

1 analyzing with PLS-SEM, namely the evaluation of measurement models related to instrument
2 validity and reliability, then followed by evaluation of structural models related to hypothesis
3 testing.

4

5 **Measurement Model Evaluation**

6 Evaluation of the measurement model (outer model) is conducted by an iterative
7 process to find out the ¹⁴ relationship between latent variables and the indicators (items) they
8 observe or in the words ¹⁴ outer model defines how each indicator is related to the latent
9 ⁶³ variable. This is related to the validity and reliability of the instruments used. To test the level
10 of validity of the instruments in this study, convergent validity and discriminant validity were
11 used.

12

13 **Convergence Validity**

14 Following the research recommendations of, to assess ⁶ convergent validity is done by
15 checking the loading factor value of each indicator for the construct that is reflected as can be
16 shown in Table 1 as follows. Hence, there were two iterations involved in this study: the first
17 iteration and the final iteration.

18

19 **Table 2.**

20 *Outer Loading Test First Iteration*

	Teaching From Home Policy (X)	E-Learning Knowledge Competency (Y)	Social Media Use Competency (Z)
X1	0.827		
X2	0.821		
X3	0.383		
X4	0.891		
Y1		0.750	
Y2		0.926	
Y3		0.866	

Y4		0.903	
Y5		0.834	
Y6		0.708	
Z1			0.630
Z2			0.900
Z3			0.824
Z4			0.752
Z5			0.892
Z6			0.923

1

2 Based on Table 2 above, the first iteration of measurement model evaluation resulted
3 that two indicators (items) X3 and Z1 had loading factors respectively 0.383 and 0.630 (<0.70).
4 Thus those indicators should be discarded from the model. This is consistent with Hair's
5 statement (2010), where each indicator is said to be an item that is satisfactory if it has a
6 loading factor above 0.70. After we deleted those items (X3 & Z1), then we run the PLS
7 algorithm for statistical analysis to obtain final iterations of the measurement model that
8 could be shown in Table 3 below:

9 **Table 3.**

10 *Outer Loading Test Final Iteration*

	Teaching From Home Policy (X)	E-Learning Knowledge Competency (Y)	Social Media Use Competency (Z)
X1	0.804		
X2	0.864		
X4	0.896		
Y1		0.750	
Y2		0.927	
Y3		0.865	

Y4		0.903	
Y5		0.833	
Y6		0.707	
Z2			0.889
Z3			0.818
Z4			0.799
Z5			0.894
Z6			0.936

1

2

3

4

5

6

7

8

9

10

Based on Table 3 for the final iteration, the loading factor value of all indicators ranged between 0.707 and 0.936. They have fulfilled and obtained satisfactory validity requirements, which is higher than 0.70 (> 0.70), indicating convergent validity has been achieved. There are a total of 14 valid indicators (item) as an observed variable in the measurement model. After the iteration process completed, the next step of the analysis was conducting the discriminant validity based on cross-loading from the final iteration of the measurement model, as shown in Tabel 4 below.

Discriminant Validity

11

12

Table 4.

Cross Loading Measurement Model Test

	X	Y	Z
X1	0.804	0.755	0.710
X2	0.864	0.782	0.627
X4	0.896	0.801	0.725
Y1	0.586	0.750	0.798
Y2	0.849	0.927	0.815
Y3	0.709	0.865	0.716
Y4	0.851	0.903	0.718

Y5	0.816	0.833	0.637
Y6	0.736	0.707	0.512
Z2	0.697	0.678	0.889
Z3	0.826	0.826	0.818
Z4	0.579	0.672	0.799
Z5	0.694	0.708	0.894
Z6	0.663	0.745	0.936

1

2

Table 4 above presents the results of evaluating discriminant validity based on the cross-loading factor value of each indicator to the construct. In accordance with Chin (2010), the correlation value of the indicator with the intended construct must be greater than the correlation value of the indicator with other constructs. In Table 4 it can be shown that the indicator X has a main loading factor with X1, X2 and X3 which are still higher than the loading factor value outside the main loading factor, namely the loading factor X1 with Y (0.755), X1 with Z (0.710), X2 with Y (0.782), X2 with Z (0.627), X4 with Y (0.801) and X4 with Z (0.725). Thus the construct X can be said to be valid discriminant.

10

64 Composite Reliability, AVE, Cronbach's Alpha and Rho_A Reliability Test

12

Instrument reliability testing is done by evaluating the value of composite reliability (CR), Average Variance Extracted (AVE), Cronbach's Alpha, and Rho_A, which can be presented in Table 5 as follows:

15

16

Table 5. 61 Reliability Test Measurement Model

17

	Composite Reliability	AVE	Cronbach's Alpha	Rho_A
Teaching From Home Policy (X)	0.891	0.732	0.816	0.817

E-Learning Knowledge Competency (Y)	0.932	0.697	0.911	0.919
Social Media Use Competency (Z)	0.939	0.755	0.918	0.922

1

2 Based on Table 5, The coefficients of ⁵⁸Composite Reliability (CR) were from 0.891 to 0.939
 3 that exceed the minimum requirement (>0.7). The coefficient of Cronbach Alpha was ranging
 4 from 0.816 to 0.918. All coefficient was higher than the minimum requirement (>0.7) and was
 5 reflected to be acceptable. The Rho_A has the lowest score of 0.817, and the highest score of
 6 0.922 also exceeds the minimum requirement or score of 0.7. Value of Average Variance
 7 Extracted (AVE) was from 0.697 to 0.755. This indicated that the value of AVE obtained was
 8 higher than the suggested minimum score. The reliability testing showed that there was
 9 adequate internal consistency.

10

⁵⁷

11 Structural Model Evaluation

12 The coefficient of determination (R Square) is commonly used to evaluate the structural
 13 model ⁵²as a measure of the model's predictive power. It is the squared correlation between a
 14 specific endogenous construct's actual and predicted values. The coefficient represents the
 15 exogenous latent variables' combined effects on the endogenous latent variable. Though R
 16 Square ranges between 0 and 1 with higher values indicating higher levels of predictive
 17 accuracy, it is, however, difficult to provide rules of thumb for acceptable R Square. This is
 18 because the values depend on the model complexity and the research discipline. Based on
 19 Table 6, the result of R Square shows Teaching From Home Policy (X), and E-Learning
 20 Knowledge Competency (Y) jointly explain 71.8% variance of Social Media Use Competency
 21 (Z). This result indicates a satisfactory level of explanation. Meanwhile, Teaching From Home
 22 Policy (X) could explain an 83.1% variance of E-Learning Knowledge Competency (Y). This
 23 result also shows a satisfactory level of explanation.

24

1 **Table 6.**
2 *R square*

	R Square	R Square Adjusted
Social Media Use Competency (Z)	0.718	0.715
E-Learning Knowledge Competency (Y)	0.831	0.830

3

4 The hypothesized relationships between the constructs were tested for significance
5 between the constructs specified in the research model. To do this, the paths of the structural
6 model were assessed when the path coefficients between the constructs were calculated, and
7 the significance of the path coefficients and the significance level were evaluated. The t values
8 were obtained in SmartPLS by running a bootstrapping procedure and using a two-tailed t-
9 distribution table to establish the significance levels of the paths. The Path coefficients and
10 significance levels were obtained by running SmartPLS with bootstrap using 500 resamples.
11 The results are presented in Tables 7 and supported by Figure 2.

12

13 **Table 7.**

14 *Structural Model Hypothesis Testing for Direct Effects*

Hypothesis	Relationship	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values
H1	X -> Y	0.912	0.912	0.017	54.809	0.000
H2	X -> Z	0.218	0.209	0.082	2.657	0.008
H3	Y -> Z	0.644	0.652	0.078	8.291	0.000

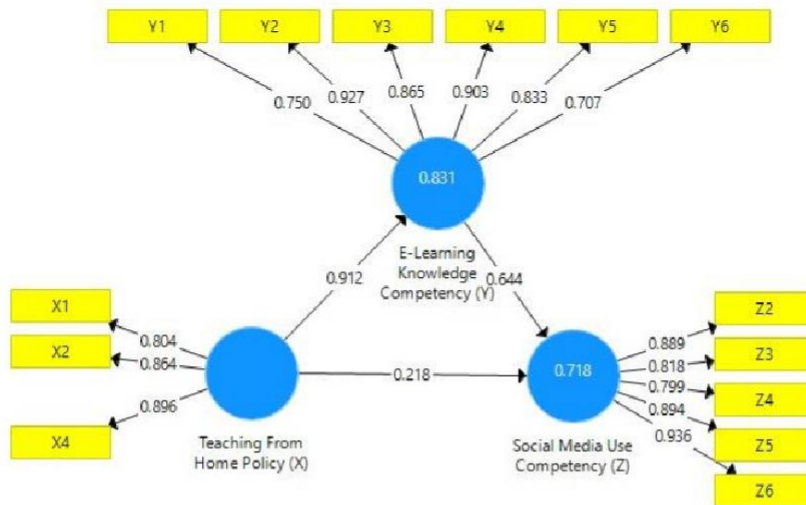

15

16 Based on Table 7 and Figure 2 below, it can be seen the hypothesis H1, H2, and H3 were
17 supported in the structural model. The hypothesis H1 indicated that Teaching From Home
18 Policy (X) is positively significant associated with E-Learning Knowledge Competency (Y) was

1 supported with t values 54.809 (>1.96) and P values 0.0000 (<0.05). The hypothesis H2
2 indicated that Teaching From Home Policy (X) is positively significant associated with Social
3 Media Use Competency (Z) was also supported with t values 2.657 (>1.96) and P values 0.008
4 (<0.05). The last The hypothesis H2 indicated that E-Learning Knowledge Competency (Y) is
5 positively significant associated with Social Media Use Competency (Z) was also supported
6 with t values 8.291 (>1.96) and P values 0.000 (<0.05). Thus all hypotheses proposed in this
7 research were proven.

8 The specific indirect effect of Teaching From Home Policy (X) was tested further. The
9 result indicated that a hypothesis that Teaching From Home Policy (X) could affect Social
10 Media Use Competency (Z) through E-Learning Knowledge Competency (Y) was also
11 supported with t values 7.817 (>1.96) and P values 0.000 (<0.05). This means construct E-
12 Learning Knowledge Competency (Y) could mediate the effect of Teaching From Home Policy
13 (X) on Social Media Use Competency (Z) partially.

14

18

Discussion

H1

20 Because e-learning has become useful in learning institutions throughout the world, e-
21 learning competency assessment is very important for the successful adoption of e-learning

1 as a learning platform. The progress of E-learning can be achieved with an awareness of the
2 level of preparation of the e-learning environment. To include e-learning, the organizations
3 involved need to be assessed so that the noble program continues to support the community
4 (Ouma et al., 2013). The next thing is the government policy of teaching at home (X) also has
5 a significant effect on the competence of e-learning knowledge (Y) based on previous studies
6 (Moghavemi et al., 2018). With the enactment of these policies, it will accustom teachers to
7 get opportunities to interact with the latest technology circulating in the community. So that
8 this speeds up the process of increasing teacher skills and understanding in learning e-
9 learning.

10 This is in line with other research on efforts to use the conceptual framework of
11 'Software Transfer' to examine the extent to which participation in cross-national learning
12 assessments has been carried out in terms of building capacity in teacher formulation and
13 influencing teachers skills in Kenya, Tanzania, and South Africa, especially in developing public
14 structures. This study develops the technical capacity to build and conduct large-scale self-
15 study assessments in the public or government education sector in South Africa and Kenya.
16 This research shows that a number of African governments are committed to building the
17 official framework needed to design and implement information institutions so that they can
18 potentially contribute to 'summative' assessments and analysis of change theories that
19 encourage participation in cross-national learning assessment sponsored by the Education
20 Action System (EFA) For all (Mulongo & Amod, 2017).

21

22 H2

23 A new teaching design during the co-19 pandemic in Indonesia, namely from home
24 teaching activities (X) which have a significant relationship to the competency of using social
25 media (Z) because the rules of using social media also have a direct impact on the activity of
26 increasing use of social media in various activities in the community, this is supported by
27 (Salehudin et al., 2019) (Ractham & Firpo, 2011) which states that learning outcomes are also
28 influenced by the use of social media. The role of the teacher in learning using Social media
29 also gives positive results because it directly impacts interacting with students, increasing

1 student morale in learning. From the results of the learning process can be proven on the
2 achievement of learning achievement according to the expectations set by the teacher.

3 An example of the US national government, how the role of teachers in providing
4 information and implementing technology incorporation in this program or policy, little focus
5 has been devoted to recognizing the practical skills and attitudes of teachers. This study
6 explores this void by examining direct factors and mediators that predict awareness of
7 technological content in teacher competencies (TPACK) and how these factors, together with
8 TPACK, influence the application of ISTE teacher education technology standards. These
9 results indicate that institutions must provide teachers in various disciplines with resources
10 that are adapted and follow a cohesive technology structure for their program (Nelson et al.,
11 2019).

12

13 H3

14 Knowledge competency of e-learning (Y) also ⁴⁴ has a significant influence on
15 competency using social media (Z) because ⁴⁶ the intensity of the use of social media is due to
16 the great understanding of knowledge from e-learning (Zha et al., 2016) (Hashim et al., 2018),
17 (Demir & Şad, 2020)(Jenkins & Dillon, 2013) (Inayat et al., 2013). The findings of this study are
18 expected to increase teacher competency in e-learning knowledge so that it impacts the
19 increased use of social media.

20 The ability of training for teachers to be multidisciplinary takes time, so mastery of the
21 e-learning technology part of the program will impact teacher learning skills ⁵⁰ the use of social
22 media. The teacher becomes part of class life. If ICT and e-learning skills in teaching practice
23 must be determined and demonstrated in a condition that is required by the government to
24 impose the use of learning technology in schools. Learning style trends should mimic real life
25 in the workplace as much as possible. Integrated real-life e-learning must also be done in
26 primary and secondary education, and this is easy to use in virtual media, such as social media,
27 to standardize the quality and insight of teachers in the use of technology (Awouters & Jans,
28 2009).

29

30

Conclusion

1 Indonesian government policies in the field of education during the Pandemic Covid-19
2 period especially in increasing competence, will improve the quality of education so that it will
3 advance the education sector, because the role of teachers in transferring knowledge to
4 students requires specialized expertise and must follow technological progress. Hence, the
5 focus of government efforts in improving Teacher qualification capacity is very appropriate.
6 How to increase the capacity of the expertise in the use of electronic learning (e-learning) and
7 virtual classrooms (classroom), which is the adoption of learning styles of developed countries,
8 it will encourage the quality of learning outcomes.

9 In the context of the use of social media will also facilitate the interaction style of
10 teachers and students inside and outside the classroom, so that makes teachers more creative
11 in innovating learning and provides a strong enthusiasm for students, so they do not get bored
12 quickly by just learning in the classroom. So in case, there has been a significant relationship
13 both between the government that makes the policy and the teacher who runs it with
14 students in the concepts of teaching and learning and there is an evaluation effort in the end.
15 So this study provides a solution in the field of education that the competence of teachers
16 using social media is influenced by government policy in increasing the competence of e-
17 learning knowledge
